Where do our Atacama Hyalella fit? cox1 gene tree

How to read it: every line end is one DNA sequence. Sequences joined by short branches are close relatives; longer branches mean more DNA difference.

Our samples: PCR (Sanger) · **Our samples: from genome assemblies** · Public database sequences (NCBI) · Public sequences, grouped · Well-supported split (≥ 0.9)

A 18 PCR · nearest: H. sp. O VI-2023a, Argentina · 97.2–99.4%

B 3 PCR · nearest: H. nefrens, Peru · 98.1–99.1%

C 3 PCR · nearest: H. azteca, Canada · 98.3–99.1%

D 2 PCR · nearest: H. azteca, France · 98.3–99.2%

E 1 genome · nearest: H. azteca, country unknown · 99.6%

F 4 PCR · nearest: H. sp. 1 AGC-2024c, USA · 97.4–99.0%

G 1 genome · nearest: H. azteca, country unknown · 99.6%

H 8 genome · nearest: H. azteca, country unknown · 99.4–99.8%

Right-hand labels: lettered group · how many of our samples · nearest public relative, its country · % DNA identity to it. FastTree GTR+Γ on 92 sequences; rooted on 8 outgroup amphipods; deep branches are unreliable.
